1)

You will be working from the drivers side of the engine and also directly over the top. You will be accessing the fuel sensor plug and the 3 individual injector connectors

2)

The first plug that you will find and access will be the fuel sensor plug. It will be on the drivers side of the engine and be a 3 prong plug at the end of the fuel rail. Compress the clip on top of the sensor and pull straight out. Put the new sensor connector into the fuel rail and put the factory connector back into the receiving end of the new harness.

- 3) Now you will locate the 3 individual injector connectors. This is a very tight installation, so be patient and you will get the connections together. The picture above and below show what you are looking for. Compress the top of the connector and pull straight out.

Place the new module connectors into the engine and then place the factory connectors into the receiving end of the module harness

Start at the flywheel with Injector "B" and work towards engine Fan "D"

4)

When you are finished with all the connectors, run the power and ground leads directly to the battery. It is VERY important to get good clean connections for the module to perform properly. If you need to take a wire brush to the terminals, please do so for the best connection.

5)

Everything should be complete at this time. Go ahead and fire up the engine to make sure everything is running properly and all connections are in place and connected correctly.

At this point all you have left is to use the provided zip ties to secure an excess harness away from any high heat areas or moving parts.

When mounting the module box, the best place would be a factory wiring harness that is stable.
